Abstract

Your abstract should be clearly structured and limited to no more than 250 words. It must be written as a single paragraph. An effective abstract provides a concise summary of the paper, including the purpose, research design or methodology, and key findings. It is also recommended to highlight how the results contribute to addressing a specific problem or closing a gap within the field of study.

Keywords

Please provide 3 to 5 keywords, listed in alphabetical order and separated by commas.

Introduction

The introductory section should offer a concise overview of the article, including its background and contextual foundation. Beginning with a broad perspective and narrowing to the specific focus, this section should establish a clear rationale for the research. This may involve presenting evidence of challenges that require solutions and/or identifying knowledge gaps within a particular domain, geographical area, community, or industry. In response, the research agenda should be clearly articulated, outlining the study's aim and objectives to clarify the purpose of the investigation.

Following this, the author should provide a general description of how the research was or will be conducted to achieve these aims and objectives. This includes a brief explanation of the research methodology, highlighting the research design, data collection techniques, and methods of analysis used or planned. Any limitations of the study should also be addressed.

The research findings should be presented by emphasizing both the originality and broader contributions of the study, as well as the specific contributions of the paper itself. It is also recommended to specify the target audience or stakeholders who are expected to benefit from the research. This discussion should be closely aligned with the rationale, aim, and objectives of the study.

The entire article should be between 5,000 and 8,000 words, with the introduction comprising approximately 20% of the total length.

Method

This section should clearly describe the research approach and/or design, along with the methods of data collection and analysis employed or intended for the study. A key aspect to address is the justification for the chosen methodology explaining why it is the most suitable option compared to other possible alternatives. This section offers authors an opportunity to demonstrate their understanding and awareness (appropriate to the level of study) of the research tools commonly used in their field and how this understanding informed the development of a sound methodology to address the research questions or problems.

It is important to note that not all papers will include a formal methodology section such as scoping papers or critical reviews. The full article should be between 5,000 and 8,000 words, with the method section comprising approximately 10% of the total length.

Findings and Discussion

This section should present and examine all findings that have emerged from the research conducted thus far. Even in early-stage studies such as those focused on preliminary literature reviews authors are expected to discuss insights synthesized from existing literature. This may involve highlighting key similarities and/or differences among various sources, as well as exploring how contextual factors (e.g., geographic location, cultural background, or other relevant variables) may influence these variations.

For papers reporting on more advanced stages of research, the results should be clearly outlined, followed by a critical analysis. Authors should demonstrate how the findings contribute to or challenge the existing body of knowledge in the relevant field. In cases where the research is complete or nearing completion authors should offer recommendations for future practice or policy based on their data analysis and interpretation of results.

This section represents a critical component of the paper, as it conveys the primary contributions of the research. The full manuscript should be between 5,000 and 8,000 words, with the findings and discussion comprising approximately 60% of the total length.

Conclusion

In this section, the author(s) should provide a concise summary of the key points discussed throughout the paper. This includes briefly revisiting the background and rationale for the study, outlining how the research was designed and conducted, summarizing the main findings, and

identifying who may benefit from the results. However, direct repetition of earlier sections should be avoided. No new information should be introduced here, except when suggesting directions for future research.

The conclusion should also highlight potential areas for further investigation. For ongoing studies, this may involve outlining the next steps needed to complete the research. For completed studies, it may include new possibilities that emerged during the research process or suggestions for expanding the study based on its original scope and limitations.

The complete manuscript should range from 5,000 to 8,000 words, with the conclusion and future research section comprising approximately 10% of the total length.

Acknowledgement

In certain cases, authors may need to acknowledge that the paper is part of a larger research project, recognize funding support provided by specific agencies, or express appreciation for contributions from colleagues who are not listed as co-authors. If no acknowledgements are required, this section should be omitted from the manuscript.

References

The reference list must be arranged in alphabetical order. All sources cited by the author(s) in the text must be included in the reference list, and every item in the reference list must be cited in the manuscript. A minimum of 10 references is required, with at least 80% consisting of peer-reviewed journal articles (not from predatory or disreputable journals), and 80% of the sources should have been published within the last 10 years. Below is an example of how references should be formatted. Authors are required to follow APA style and are encouraged to use reference management tools such as EndNote, Zotero, or Mendeley. A complete APA citation guide can be found here: <https://www.mendeley.com/guides/apa-citation-guide/>
